I went to the launderette to do my washing because it was Wednesday. Wednesday was washing day. I was tired as it was late. Suddenly, I noticed something strange inside the washing machine. It was a fish! Was I dreaming? It can't be a fish, surely it was just a sock...

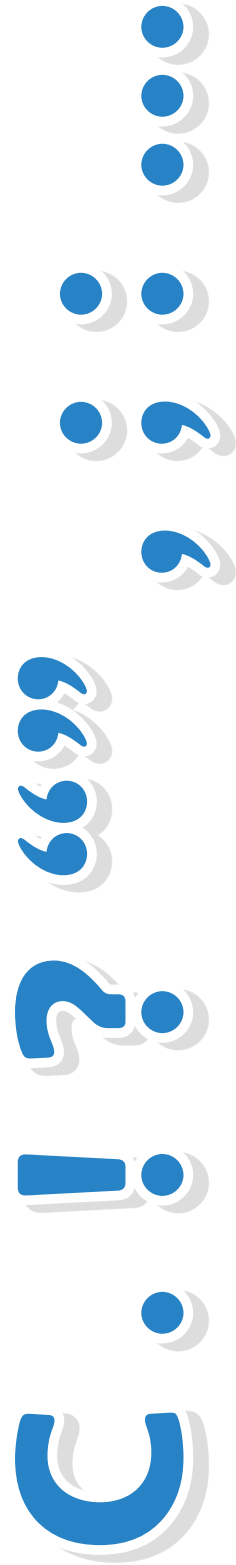

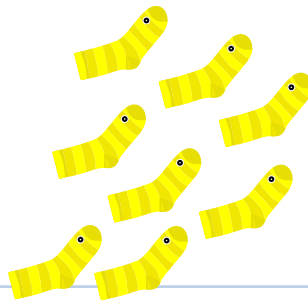

Slowly, I got out of my seat and went to have a closer look. Shocked, I saw it again. My sock had transformed into a fish and there were schools of them! Did I own that many socks? After that, I opened the door. Carefully, I reached out and touched the bubble of water leading to the underwater world. Then, I took a deep breath and put my head inside. I swam through a dark, narrow tunnel and that's when I saw it...

The Green Turtle has 4 flippers. It has a hard shell and scales. They are a greenish colour.

Green Turtles live mainly in tropical seas because the water is warm.

Green Turtle

Green Turtles are reptiles.

The female Green Turtle lays between 60 and 150 eggs on the beach. She buries them in the sand to protect them.

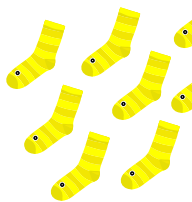

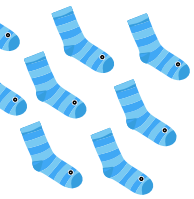

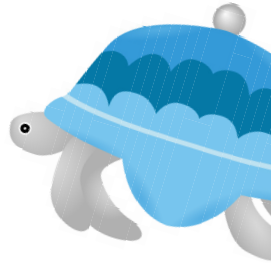

Green Turtles use their strong flippers to glide through the water. On land they are heavy and slow.

The male Green Turtle never comes onto the land.

Green Turtle eat sea grass, algae, jellyfish and the fruits of mangrove trees.

## Sea Life

The under water world is teeming with life. In oceans and seas all over the planet, many different creatures make their homes. Everyday, new creatures are being discovered. Read on to learn more facts about one of these amazing animals... the green sea turtle.

### Appearance

The green turtle is one of the largest sea turtles. Green turtles are named because of the greenish colour of their fat, not their shells. Most green turtles are brown and black or greenish-yellow. Green sea turtles have flippers that allow the turtle to move quickly and easily through the water and, unlike many other turtles, green sea turtles cannot pull their head into their shell.

### Threats

Green turtles are endangered. They are threatened by hunters, by being caught in fishing equipment and by the destruction of their eggs.

### Habitat

Green turtles are found mainly in tropical waters. They are sometimes found in the Mediterranean Sea and have even been found in the sea around Great Britain. Adult turtles migrate over very long distances between their feeding grounds and the beaches from where they hatched.

### Diet

Adult green turtles are herbivores. They feed mainly on seagrass or algae. They have powerful jaws to help them tear up their food. Healthy green turtles live a very long time. Some can live 80-100 years or even more!
